

# Deploy the application with Docker

[!IMPORTANT]

Replace values such as `gXX`, `40XX`, `50XX`, `60XX`, and `dockerhub_userXXX` with the values assigned to your group.

## 1. Create a Docker volume and network

The volume keeps database files when the database container is removed. The network lets the containers find one another by container name.

```
DOCKER_VOLUME_NAME='gXX_volume'  
DOCKER_NETWORK_NAME='gXX_network'  
  
docker volume create ${DOCKER_VOLUME_NAME}  
docker network create ${DOCKER_NETWORK_NAME}
```

## 2. Start PostgresSQL
